Date of Signature: January 30, 2003

Assistant Commissioner for Patents Washington, D.C. 20231

CERTIFIED COPIES OF FOREIGN PRIORITY, APPLICATIONS

Dear Sir:

At the time of filing the above-captioned patent application. Applicants claimed foreign priority benefits from PCT/EP01/09815, filed August 24, 2001 and DE 10109166.4, filed February 25, 2001. In fulfillment of the requirements of §119, a certified copy of each of the foreign priority documents is enclosed.

Respectfully submitted,

January 30, 2003

CANDICE J. CLEMENT, ESQ.

Avilamycin-Derivate

15

20

25

30

Die Erfindung betrifft Avilamycin-Derivate, gentechnologische biosynthetische Verfahren zu deren Herstellung, Arzneimittel enthaltend diese Verbindungen, sowie die Verwendung dieser Verbindungen zur Herstellung eines Arzneimittels, bspw. gegen Infektionskrankheiten, wie auch Nukleinsäuren, Proteine und Gencluster und entsprechende Zellen, die mit der Herstellung dieser Avilamycin-Derivate verbunden sind.

Das Aufkommen pathogener, gegen Antibiotika multiresistenter Bakterien stellt eine wachsende Bedrohung der menschlichen Gesundheit dar und hat die Suche nach neuen Wirkstoffen verstärkt. Immer weniger neue Wirkstoffe sind in den letzten zwei Jahrzehnten bei zielspezifischen Wirkstoff-Screenings angefallen, so daß Forscher begonnen haben, neben der Suche nach neuen antibiotischen Wirkstoffen auch neue Technologien zur Herstellung neuer Verbindungen zu nutzen. Eine vielversprechende neue Technologie wird als kombinatorische Biosynthese bezeichnet und benutzt biosynthetische Gene als Mittel zur Herstellung neuer Wirkstoffe.

Eine unter anderem in diesem Kontext interessante Verbindungsklasse sind die Orthosomycine. Sie sind eine bekannte Klasse von Antibiotika, die von verschiedenen Actinomyceten hergestellt werden. Mitglieder dieser Klasse wirken auf eine breite Palette gram-positiver pathogener Bakterien, inclusive glycopeptid-resistenter Enterococci, methicillin resistenter Staphylococcen and penicillin-resistenter Streptococcen.

Prominente Orthosomycinen sind Avilamycin Beispiele an und Everninomicin, die von Streptomyces viridochromogenes Tü57 bzw. Micromonospora carbonacea hergestellt werden. Diese Antibiotika bestehen aus einer Heptasaccharid-Seitenkette und einer vom Polyketid abgeleiteten Dichloroisoevernin-Säure als Aglykon, wobei die Zucker-Reste zum Teil über Orthoesterbindungen miteinander verknüpft sind. Diese Bindung gibt der ganzen Klasse von Orthosomycinen den Namen. Der genaue Wirkmechanismus der Orthosomycine ist unbekannt. Während für für ein bestimmtes Orthosomycin (Ziracin) Zellmembraneffekt diskutiert wurde (Walker, 1976; Langer, 1987) wird in neueren Publikationen eine Wechselwirkung mit dem ribosomalen Protein L16 angeführt (Foster und Rybak, 1999). Für ein anderes Orthosomycin, Avilamycin A, wird eine Hemmung der Proteinbiosynthese angenommen und eine Inhibition des Translations-Initiationskomplexes vorgeschlagen (Wolf, 1973).

10

15

20

Das bekannte Avilamycin wurde 1959 aus Kulturfiltraten von Streptomyces viridochromogenes Tü57 isoliert (Buzzetti, et al., 1968; Mertz et al., 1986). Wie oben bereits angedeutet ist Avilamycin A, eine der Hauptkomponenten, aus Zuckern aufgebaut. Einzelkomponenten sind D-Olivose, 2-Desoxy-D-Evalose, 4-0-Methyl-D-fucose, 2,6-Di-0-Methyl-D-mannose und L-Lyxose. In Studien wies Avilamycin A ausgezeichnete

Aktivität gegen multiresistente Staphylococcus aureus - Stämme auf (Zähner, 1999). Neben den Orthoestern soll der terminale Dichloroisoeverninsäure-Rest für die Wirksamkeit essentiell sein (Wright, 1979). Die DE 1116864 beschreibt wie die US 3,131,126 den Stoff Avilamycin inclusive eines allgemeinen Hinweises auf Derivate sowie Herstellung und Wirkung von Avilamycin.

Ebenfalls zur Gruppe der Orthosomycine gehört Ziracin. Ziracin (SCH27899) ist ein Everninomycin und wurde bereits klinisch getestet.

 $H_{l,C} \xrightarrow{H_{l}COH_{l}C} \xrightarrow{H_{l}COH_{l}C} \xrightarrow{H_{l}COH_{l}C} \xrightarrow{H_{l}COH_{l}C} \xrightarrow{OH} \xrightarrow{OH}$

Sowohl beim Avilamycin als auch beim Ziracin hat sich in der Praxis allerdings gezeigt, daß der therapeutische Einsatz durch die zu geringe Hydrophilie beschränkt zu sein scheint.

Gerade für die Klasse der Orthosomycine und insbesondere für das Avilamycin dürfte molekulares Klonieren und Charakterisieren der die Biosynthese von Avilamycin A bestimmenden Enzyme von großem Interesse sein, da diese Information die Richtung für die Entwicklung neuer antimikrobieller Antibiotika vorgeben könnte. Die Gene sind ein interessantes System, um die Bildung und Verknüpfung ungewöhnlicher

. 25

Desoxyzucker zu studieren und damit unter Umständen für eine kombinatorische Biosynthese von großem Wert.

Vorherige Arbeit am biosynthetischen Gencluster von Avilamycin führten zur Entschlüsselung der Sequenz eines NDP-Glucose-Synthase-Gens (aviD [laufende Nr. 53 gemäß Tabelle 1]), eines NDP-Glucose-4,6-Dehydratase-Gens (aviE [laufende Nr. 54 gemäß Tabelle 1]) und eines Polyketid-Synthase-Gens (aviM (laufende Nr. 52 gemäß Tabelle 1]). Diese haben vermutlich eine Funktion als Teil einer iterativen Typ I Polyketid-Synthase zur Bildung von Orsellin-Säure, einem Zwischenprodukt in der Biosynthese von Dichloroisoeverninsäure. Die Expression von aviM in S. lividans führte zur Bildung von Orsellinsäure [Gaisser, S., Trefzer, A., Stockert, S., Kirschning, A., & Bechthold, A. (1997), J Bacteriol. 179, 6271-6278].

15

Neben dem Auffinden und Identifizieren geeigneter Enzymsysteme und Synthesewege war es daher Aufgabe der Erfindung, neue Antibiotika zur Verfügung zu stellen, insbesondere auch solche, die eine verbesserte Hydrophilie aufweisen.

20

25

Überraschenderweise stellte sich heraus, daß bestimmte Avilamycin-Derivate - insbesondere mit einem in entscheidenden Bereichen gegenüber dem Avilamycin veränderten Substitutionsmuster - diese Aufgabe lösen können und sowohl antibiotische Wirkung als auch verbesserte Hydrophilie zeigen. Ein Gegenstand der Erfindung ist daher ein Avilamycin-Derivat gemäß allgemeiner Formel I, auch in Form seiner Diastereomere oder Enantiomere bzw. razemischer oder anderer Gemische oder reiner Diastereomere und/oder Enantiomere.

Name of the compound	R1	R2	R3	R4
Avilamycin A	COCH ₃	OCH ₃	Cl	Cl
Avilamycin C	CH(OH)CH ₃	OCH ₃	Cl	Cl
Gavibamycin A1	COCH ₃	OH	Cl	Cı
Gavibamycin A3	CH(OH)CH ₃	OH	Cl	Cl
Gavibamycin B1		ОН	H	H
Gavibamycin B3	CH(OH)CH ₃	OH	H	H

10

5

15

, worin unabhängig voneinander mit unten folgender Ausnahme

R1 ausgewählt ist aus H, COCH $_3$, COC $_4$ H $_9$ oder COCH(CH $_3$) $_2$, COCH $_2$ CH $_3$

20

R2 ausgewählt ist aus H, CHO, COCH₃ oder CH(OH)CH₃,

Q)

R3 OCH₃ entspricht,

R4 CI entspricht,

25

R5 CI entspricht,

R6 CH₃ entspricht,

30

R7 H, CH₃ oder CH₂OH entspricht,

und

R8 OCH₃ entspricht,

worin in bezug auf mindestens einen der Reste R2-R8 in Formel I abweichend von der voranstehenden Definition folgendes gilt:

R3 ist durch OH zu ersetzen,

10 R4 ist durch H zu ersetzen,

R5 ist durch H zu ersetzen.

R6 ist durch H zu ersetzen,

15

und/oder

R8 ist durch OH zu ersetzen.

20

mit der Maßgabe, daß R1-R8 nicht gleichzeitig die Bedeutungen gemäß der jeweiligen Kombination in einer der Verbindungen 1 - 6 annehmen können:

Nr.	R1	R2	R3	R4	R5	R6	R7	R8
1	COCH(CH ₃) ₂	COCH ₃	ОН	Н	CI	CH₃	CH ₃	OCH ₃
2	COCH(CH ₃) ₂	COCH ₃	OCH ₃	CI	Н	CH ₃	CH ₃	OCH ₃
3	COCH(CH ₃) ₂	COCH ₃	OCH ₃	CI	CI	Н	CH ₃	OCH ₃
4	COCH(CH ₃) ₂	COCH ₃	OCH ₃	CI	CI	CH ₃	CH ₃	ОН

25

Dabei ist unter dem Ausdruck "mit unten folgender Ausnahme" zu verstehen, daß es Ausnahmen von den diesem Ausdruck unmittelbar

folgenden generellen Definitionen der Reste R1-R8 gibt, die mit der Phrase "worin in bezug auf mindestens einen der Reste R2-R8 in Formel I abweichend von der voranstehenden Definition folgendes gilt" eingeleitet werden.

Ggf. können die mit CI halogenierten Reste, insbesondere R4 und/oder R5, auch durch andere Halogenide, bspw. F oder Br, halogeniert werden.

5

10

15

20

Die erfindungsgemäßen Avilamycin-Derivate zeichnen sich insgesamt neben ihrer überraschend starken antibiotischen Aktivität insbesondere gegen *Stapphylococcus aureus*, insbesondere auch durch eine gegenüber den bekannten Orthosomycinen wie Avilamycin A oder C sowie Evernimycin deutlich verbesserten Hydrophilie aus. Gerade diese erhöhte Hydrophilie macht diese Verbindungen aber zu attraktiven, insbesondere antibiotischen Wirkstoffen, da eine erhöhte Hydrophilie in bestimmten therapeutischen Anwendungen sehr erwünscht ist. Außerdem gilt für dieses wie für alle – auch folgend beschriebenen - erfindungsgemäßen Avilamycin-Derivate, daß es eine Struktur aufweist, die sich einer klassischen organischen Synthese nur mit großer Mühe erschließt. Der hier zugrundeliegende Einsatz einer gentechnologischen Biosynthese zu Herstellung der erfindungsgemäßen Avilamycin-Derivate erschließt damit veränderte, neue und bisher nicht zugänglich Wirkstoffe, insbesondere Antibiotika.

Bevorzugt ist im Rahmen dieser Erfindung ein erfindungsgemäßes Avilamycin-Derivat, in dem mindestens R3 durch OH zu ersetzen ist, mit der Maßgabe, daß R1-R8 nicht gleichzeitig die Bedeutungen gemäß der Kombination in der Verbindung 1 annehmen können:

Nr.	R1	R2	R3	R4	R5	R6	R7	R8
1	COCH(CH ₃) ₂	COCH ₃	ОН	Н	CI	CH₃	CH₃	OCH ₃

Ebenfalls bevorzugt ist ein erfindungsgemäßes Avilamycin-Derivat, in dem mindestens R4 und R5 in Formel I durch H zu ersetzen sind.

Besonders bevorzugt ist es weiter, diese Merkmale zu kombinieren, was zu einem erfindungsgemäßen Avilamycin-Derivat führt, in dem mindestens R3 durch OH und R4 und R5 durch H zu ersetzen sind.

Ein besonders bevorzugter Gegenstand der Erfindung, der die Aufgabe in besonders günstiger Weise löst, ist dabei ein Avilamycin-Derivat gemäß allgemeiner Formel I, das ausgewählt ist aus Verbindungen, in denen R1-R8 jeweils die in folgender Tabelle angegebene Bedeutung haben, wie folgt kombiniert sind:

R1	R2	R3	R4	R5	R6	R7	R8
COCH(CH ₃) ₂	COCH ₃	ОН	CI.	CI	CH ₃	CH ₃	OCH ₃
COCH ₂ CH ₃	Н	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
COCH ₃	COCH ₃	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
COCH(CH ₃) ₂	CH(OH)CH₃	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
<u>H</u>	COCH ₃	ОН	CI	CI	CH₃	CH ₃	OCH ₃
COCH ₃	CH(OH)CH₃	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
Н	CH(OH)CH₃	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
COC ₄ H ₉	COCH ₃	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	CI	Н	CH ₃	CH ₃	OCH ₃
COCH ₂ CH ₃	COCH ₃	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	CI	CI	Н	CH ₃	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	CI	CI	CH ₃	CH₂OH	OCH ₃
COCH(CH ₃) ₂	СНО	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	CI	CI	CH ₃	Н	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	CI	CI	CH ₃	CH ₃	ОН
COCH(CH ₃) ₂	COCH ₃	ОН	Н	Н	CH ₃	CH ₃	OCH ₃
COCH ₂ CH ₃	Н	ОН	Н	Н	CH ₃	CH ₃	OCH ₃
COCH ₃	COCH ₃	ОН	Н	Н	CH ₃	CH ₃	OCH ₃
COCH(CH ₃) ₂	CH(OH)CH ₃	ОН	Н	Н	CH ₃	CH ₃	OCH ₃
Н	COCH ₃	ОН	Н	Н	CH ₃	CH ₃	OCH ₃
COCH ₃	CH(OH)CH₃	ОН	Н	Н	CH ₃	CH ₃	OCH ₃
Н	CH(OH)CH₃	ОН	Н	Н	CH ₃	CH₃	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	Н	Н	CH ₃	CH ₃	OCH ₃

COC₄H ₉	COCH ₃	ОН	Н	Н	CH ₃	CH ₃	OCH₃
COCH(CH ₃) ₂	COCH ₃	ОН	Н	Н	CH ₃	CH₃	OCH ₃
COCH ₂ CH ₃	COCH ₃	ОН	Н	Н	CH₃	CH₃	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	Н	Н	Н	CH ₃	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	Н	Н	CH ₃	CH₂OH	OCH ₃
COCH(CH ₃) ₂	CHO	ОН	Н	Н	CH ₃	CH₃	OCH ₃
COCH(CH ₃) ₂	COCH ₃	ОН	Н	Н	CH ₃	Н	OCH₃
COCH(CH ₃) ₂	COCH ₃	ОН	Н	Н	CH ₃	CH₃	ОН

Die Aufgabe wird auch durch Avilamycin-Derivate gelöst, die durch ein besonderes Verfahren, das gentechnologische Manipulationen und Bioynthese beinhaltet herstellbar ist. Ein weiterer Gegenstand der Erfindung ist daher ein Avilamycin-Derivat, das dadurch erhältlich ist, daß in einer kultivierbaren Zelle, die die nötigen Gene bzw. Enzyme zur Synthese eines Orthosomycin-Grundkörpers bestehend aus

10

- (a) einem endständigen Dichloroisoeverninsäure-Rest (A in Formel I) und
- (b) einem damit veresterten, über normale Esterbindung und Orthoesterbindungen verknüpften Heptasaccharid (B bis H in Formel I) aus:

15

- (i) zwei D-Olivose-Resten (B und C)
- (ii) einem 2-Desoxy-D-Evalose-Rest (D),
- (iii) einem D-Fucose (E),
- (iv) einem D-Mannose-Rest (F),

(v) einem L-Lyxose-Rest (G) und

(vi) einem (Methyl-)Eurekanat Rest (H)

aufweist, mindestens eine Nukleinsäure, deren Sequenz zu

25

20

mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen gemäß

laufender Nummer 1 bis 54 (gemäß Tabelle 1 i.V.m. Abb. 1) und Abbildung 1 entspricht oder aber mit einer dieser Sequenzen unter mäßig stringenten Bedingungen hybridisiert, gentechnologisch verändert, deletiert und/oder nicht exprimiert wird, die so modifizierte Zelle kultiviert wird, der Kulturüberstand gewonnen und aufgearbeitet wird, das oder die Avilamycin-Derivat/e aufgereinigt und isoliert wird und gegebenenfalls verschiedene Derivate getrennt werden,

10

5

mit der Maßgabe, daß R1-R8 nicht gleichzeitig die Bedeutungen gemäß der jeweiligen Kombination in einer der Verbindungen 1 - 16 annehmen können:

Nr.	R1	R2	R3	R4	R5	R6	R7	R8
1	COCH(CH ₃) ₂	COCH ₃	ОН	Ι	C	CH₃	CH₃	OCH ₃
2	COCH(CH ₃) ₂	COCH₃	OCH ₃	ō	Ι	CH₃	CH ₃	OCH ₃
3	COCH(CH ₃) ₂	COCH ₃	OCH ₃	C	CI	Н	CH₃	OCH ₃
4	COCH(CH ₃) ₂	CHO	OCH ₃	CI	CI	CH ₃	CH₃	OCH ₃
5	COCH(CH ₃) ₂	COCH ₃	OCH ₃	CI	CI	CH ₃	Н	OCH ₃
6	COCH(CH ₃) ₂	COCH ₃	OCH ₃	CI	CI	CH ₃	CH₃	ОН
7	COCH(CH ₃) ₂	COCH ₃	OCH ₃	CI	Cľ	CH ₃	CH₃	OCH ₃
8	COCH ₂ CH ₃	Н	OCH ₃	CI	CI	CH ₃	CH₃	OCH ₃
9	COCH ₃	COCH ₃	OCH ₃	CI	CI	CH ₃	CH₃	OCH ₃
10	COCH(CH ₃) ₂	CH(OH)CH₃	OCH ₃	CI	CI	CH₃	CH₃	OCH ₃
11	Н	COCH ₃	OCH ₃	CI	CI	CH₃	CH₃	OCH ₃
12	COCH ₃	CH(OH)CH₃	OCH ₃	CI	ÇI	CH₃	CH ₃	OCH ₃
13	H	CH(OH)CH₃	OCH ₃	CI	CI	CH ₃	CH ₃	OCH ₃
14	COC₄H ₉	COCH ₃	OCH ₃	CI	CI	CH ₃	CH₃	OCH ₃
15	COCH(CH ₃) ₂	COCH ₃	OCH ₃	CI	CI	CH₃	CH₂OH	OCH ₃
16	COCH ₂ CH ₃	COCH ₃	OCH ₃	CI	CI	CH₃	CH ₃	OCH ₃

Dabei versteht man im Sinne der Erfindung darunter, daß "die Zelle die nötigen Gene bzw. Enzyme zur Synthese eines Orthosomycin-Grundkörpers aufweist", daß in der Zelle die für die notwendigen Enzyme kodierenden Gene und/oder die funktionsfähigen Enzyme selbst vorhanden sind, die für die Synthese eines "Orthosomycin-Grundkörpers"

aus den üblicherweise vorhandenen Vorstufen nötig sind. Beispiele wären das erfindungsgemäße Gencluster gemäß Abb. 109 oder die "Open Reading Frames" (ORF) bzw. Gene gemäß laufender Nummer 1-54 gemäß Tabelle 1 i.V.m. Abb. 1 bzw. die zugehörigen Enzyme bzw. Proteine gemäß laufender Nummer 55-108 gemäß Tabelle 1 i.V.m. Abb. 1.

Die Definition des "Orthosomycin-Grundkörpers" ist bereits angegeben, wobei die Anordnung der Ortho- und der normalen Esterbindung der Formel I zu entnehmen ist. Einen solchen Grundkörper weisen unter anderem Avilamycin und Evernimycin sowie erfindungsgemäße Avilamycin-Derivate auf (s. Formel I).

Weiter versteht man im Sinne dieser Erfindung unter <u>Gen</u> einen Abschnitt der DNA, von dem ein einzelnes mRNA-Molekül (das dann in ein einzelnes Polypeptid oder Protein translatiert wird) oder ein funktionelles RNA-Molekül (rRNA, tRNA) transkribiert wird.

Im Sinne dieser Erfindung versteht man weiter unter "Open Reading Frame" (ORF) einen DNA-Abschnitt, der mit einem Start-Codon beginnt, mit einem End-Codon endet und eine ununterbrochenen Folge von Codons für Aminosäuren enthält. Der Begriff "Open Reading Frame" ORF wird hier zur Beschreibung eines klonierten und sequenzierten DNA-Abschnitts verwendet, der einem Gen entspricht.

25

15

20

Unter <u>Codon</u> versteht man die kodierende genetische Grundeinheit. Sie besteht aus einem Triplett von drei konsekutiven Nukleotiden, die entweder für eine Aminosäure oder den Beginn oder das Ende einer Polypeptidkette kodieren.

Weiter sind im Sinne dieser Erfindung unter kultivierbaren Zellen Zullen zu verstehen, die in-vitro in festem oder flüssigem Medium ernährt durch eine flüssige oder verfestigte Nährlösung, dem Kulturmedium, wachsen und sich vermehren. Im engeren Sinne sind dies insbesondere Zellen von Mikroorganismen oder leicht transfizierbare Zellen, entsprechende Gene zur Expression gebracht werden können. Es können dies beispielsweise grampositive und gramnegative Bakterienzellen, wie z.B. Streptomyces-Zellen (z.B. Streptomyces viridochromogenes Tü 57), aber eben auch Systeme wie Säugetierzellen, z.B. CHO-Zellen (Chinese Hamster Ovary), oder immortalisierte Zellinien, z.B. HeLa- oder HEK-Zellen, aber auch Insekten-, Fisch-, Amphibien-, Pilze- oder Hefezellen etc. sein.

5

10

15

20

25

30

Unter einer Nukleinsäure versteht man im Sinne dieser Erfindung die Grundeinheit von DNA und RNA und damit insbesondere auch die Grundeinheit eines Gens und eines ORF. Entsprechend kann eine Nukleinsäure ein Gen bzw. einen ORF umfassen und eine bestimmte Nukleinsäuresequenz (die Abfolge der Basen auf dem Phosphat-Zucker-Rüchrat einer Nukleinsäure) entsprechend ein Gen bzw. einen ORF definieren. Unter Nukleinsäure werden auch Sequenzen verstanden, die neben den codierenden Bereichen auch weitere Sequenzbereiche, insbesondere am 5'- oder am 3'-Ende des codierenden Bereichs, enthalten. Diese Sequenzen können funktionslos sein oder aber Promotor- oder Enhancer-Signale, bevorzugt bakterielle bzw. dem zur Expression herangezogenen Wirtszellsystem entsprechende Signale, sein. Ganz besonders bevorzugt neben für sind den erfindungsgemäßen Proteine codierenden Sequenzbereichen solche Nukleotidsequenzen, die für sog. "Tags" codieren (bspw. His- oder Flag-Tag), so daß die in den Wirtszellen exprimierten erfindungsgemäßen Proteine bspw. über Affinitätschromatographie ohne weiteres gereinigt werden können. An erfindungsgemäße codierende Nukleotidsequenzen

können damit beliebige Sequenzen vorzugsweise am 5' oder 3'-Ende angehängt werden, die für AS-Sequenzen codieren, die einen Tag (bspw. ein Antigen) zur Bindung an einen Antikörper bspw. auf einer Säule enthalten. Mitoffenbart sind damit auch die AS-Sequenzen, die sich aus der Kombination von codierenden erfindungsgemäßen Nukleinsäuren mit anderen Nukleotidsequenzen ergeben.

Unter gentechnologisch ist im Sinne der Erfindung der Einsatz verschiedener Techniken zu verstehen, mit der DNA in eine Wirtszelle eingebracht wird bzw. DNA einer Zelle spezifisch verändert wird. Darunter fällt z.B. der Einsatz von Klonierungstechniken, Vektoren, Restriktionsenzymen etc..

Entsprechend heißt gentechnologisch verändert, daß ein Eingriff die Basenfolge, die Sequenz, der Nukleinsäure verändert hat, insbesondere die Basensequenz verkürzt (bis hin zur Deletion) oder Mutationen eingebaut wurden, meist mit der Folge, daß die Nukleinsäure (das Gen) nicht oder nur noch verändert in eine mRNA transkribiert werden kann. Deletiert heißt in diesem Falle, daß eine Nukleinsäure, die hier meist ein Gen oder einen ORF umfaßt, ganz oder zumindest weitgehend aus der DNA entfernt wird, so daß die Nukleinsäure (das Gen) nicht oder nur noch verändert in eine mRNA transkribiert werden kann. Nicht exprimiert bedeutet entsprechend, daß die Nukleinsäure so verändert wurde, daß die Nukleinsäure (das Gen) nicht oder nur noch verändert in eine mRNA transkribiert werden kann und entsprechend nicht mehr durch Translation das Polypeptid bzw. Protein entsteht, für das die Nuleinsäure (das Gen oder der ORF) ursprünglich kodiert hat.

10

15

20

Unter mäßig stringenten Hybridisierungsbedingungen werden je nach der verwendeten Nukleinsäure-Sequenz (Oligonukleotid, längeres Fragment oder vollständige Sequenz) bzw. je nachdem, welche Nukleinsäureart (DNA oder RNA) für die Hybridisierung verwendet werden, variierende Standardbedingungen verstanden. So liegen beispielsweise Schmelztemperaturen für DNA:DNA-Hybride ca. 10 °C niedriger als die von DNA:RNA-Hybriden gleicher Länge. Unter Standardbedingungen sind beispielsweise, je nach Nukleinsäure, Temperaturen zwischen 42 und 58 °C in einer wäßrigen Pufferlösung mit einer Konzentration zwischen 0,1 bis 5 x SSC (1 X SSC = 0,15 M NaCl, 15 mM Natriumcitrat, pH 7,2) oder zusätzlich in Gegenwart von 50% Formamid, wie beispielsweise 42 °C in 5 x SSC, 50% Formamid, zu verstehen. Vorteilhafterweise liegen die Hybridisierungsbedingungen für DNA:DNA-Hybride bei 0,1 x SSC und Temperaturen zwischen etwa 20 °C bis 45 °C, bevorzugt zwischen etwa-30 °C bis 45 °C. Für DNA:RNA-Hybride die liegen Hybridisierungsbedingungen vorteilhaft bei 0,1 x SSC und Temperaturen zwischen etwa 30 °C bis 55 °C, bevorzugt zwischen etwa 45 °C bis 55 °C. Diese angegebenen Temperaturen für die Hybridisierung sind beispielhaft kalkulierte Schmelztemperaturwerte für eine Nukleinsäure mit einer Länge von ca. 100 Nukleotiden und einem G + C-Gehalt von 50 % in Abwesenheit von Formamid. Die experimentellen Bedingungen für die DNA-Hybridisierung sind in einschlägigen Lehrbüchern der Genetik, wie beispielsweise bei Sambrook et al. ("Molecular Cloning", Cold Spring Harbor Laboratory, 1989), beschrieben und lassen sich nach dem Fachmann bekannten Formeln, beispielsweise abhängig von der Länge der Nukleinsäuren, der Art der Hybride oder dem G + C-Gehalt berechnen. Weitere Informationen zur Hybridisierung kann der Fachmann folgenden Lehrbüchern entnehmen: Ausübel et al. (eds), 1985, Current Protocols in Molecular Biology, John Wiley & Sons, New York; Hames and Higgins (eds), 1985, Nucleic Acids Hybridization: A Practical Approach, IRL Press at Oxford University Press, Oxford; Brown (ed), 1991, Essential

5

10

15

20

25

Molecular Biology: A Practical Approach, IRL Press at Oxford University Press, Oxford.

Unter <u>Kultivierung</u> ist im Sinne dieser Erfindung die *in-vitro* Zucht von kultivierbaren Zellen zu verstehen, wodurch diese in festem oder flüssigem Medium ernährt durch eine flüssige oder verfestigte Nährlösung, dem Kulturmedium, wachsen und sich vermehren.

Dabei versteht man unter Kulturüberstand das flüssige Kulturmedium, das neben den Nährstoffen für die kultivierbaren Zellen auch die von diesen nach außen ins Medium abgegebenen Metaboliten und Substanzen (z.B. Avilamycin-derivate) enthält. Dieser Kulturüberstand kann gewonnen und aufgearbeitet werden, wobei darunter insbesondere das Absaugen des Überstandes und/oder eine Filtration zu verstehen ist, mit der die aus der Kultivierung und den Zellen übriggebliebenen Feststoffe abgetrennt werden.

10

15

20

25

30

Der Kulturüberstand, der im Rahmen dieser Erfindung erfindungsgemäße Avilamycin-Derivate enthält, kann nach der Aufarbeitung aufgereinigt werden, wobei darunter beispielsweise eine chromatographische Trennung und/oder Trennung über Flüssigphasen bzw. eine Kombination dieer Vorgehensweisen zu verstehen ist. Beispiele dafür sind eine Festphasen-Extraktion mit einem Methanol-in-Wasser-Gradienten oder eine Ethyl-Acetat-Extraktion. Dabei wird die die Avilamycinderivate enthaltende Fraktion möglichst weitgehend von anderen. andere Bestandteile des Kulturüberstands enthaltenden Fraktionen getrennt und damit die Avilamycin-Derivate weitgehend isoliert. Als alternative Trenn- und/oder Reinigungsverfahren kommen jedoch auch Methode des Aussalzens oder Um- oder Auskristallisierens in Betracht. Gegebenenfalls kann sich dann eine Isolierung und Trennung der einzelnen Derivate anschliessen. wobei hier insbesondere

Chrotographiemethoden eingesetzt werden. Ganz besonders bevorzugt sind dabei präparative HPLC-Methoden oder auch affinitätschromatographische Verfahren.

Es ist bevorzugt, wenn beim Herstellungsverfahren, über das das erfindungsgemäße Avilamycin-Derivat definiert wird, die kultivierbare Zelle ausgewählt ist aus einer Zelle vom Typ Streptomyces viridochromogenes oder einer Zelle, die mit Ausnahme der gentechnologisch veränderten, deletierten oder nicht exprimierten Nukleinsäure/n die Nukleinsäuren gemäß laufnder Nr. 1-54 gemäß Tabelle 1 i.V.m. Abb. 1 bzw. dazu zu mindestens 95%, vorzugsweise 97 %, homologe Nukleinsäuren enthält oder aber mit einer dieser Sequenzen unter mäßig stringenten Bedingungen hybridisiert oder das Gencluster gemäß Abb. 109 enthält. Unter dem zweiten Punkt der Auswahl sind insbesondere Zellen zu verstehen, in denen durch gentechnologische Methoden die für die Avilamycin-Derivat-Synthese notwendigen Enzyme exprimiert werden, wobei eine der für ein in den Streptomyces viridochromogenes Tü 57 endogen vorkommenden Enzym kodierenden Nukleinsäuren gentechnologisch verändert oder deletiert ist bzw. nicht exprimiert wird, insbesondere die Nukleinsäure/DNA gar nicht erst gentechnologisch in die Wirtszelle eingebracht wird. Besonders bevorzugt ist es aber, wenn die ausgewählt ist aus einer Zelle vom Typ Streptomyces viridochromogenes, insbesondere einer Zelle vom Typ Streptomyces viridochromogenes Tü 57 bzw. A 23575.

25

5

10

15

20

In jedem Falle ist es bevorzugt, wenn bei dem Verfahren die veränderte/n (z.B. deletierte/n bzw. nicht in die Wirtszelle eingebrachte/n) Nukleinsäure/n für eine Methyltransferase und/oder für eine Halogenase kodierte/n.

Alternativ kann die Herstellung auch außerhalb eines in vivo Verfahrens als in vitro Synthese erfolgen. Hierbei werden die für die Synthese erforderlichen Enzyme und/oder Enzymsysteme in mindestens einem Versuchsansatz vorgegeben, wobei vorzugsweise in mehreren hintereinander geschalteten Versuchsansätzen die für die Synthese erforderlichen Reaktionsschritte katalytisch von den erforderlichen und erfindungsgemäßen Enzymen durchgeführt werden. Ggf. können zwischen die in entsprechend geeigneter Reihenfolge durchgeführten Einzelreaktionen Trenn- und/oder Reinigungsschritte zur Aufreinigung der der jeweils erwünschten Zwischenprodukte eingefügt werden.

10

15

20

Dabei versteht man unter <u>Methyltransferasen</u> Enzme, die eine Methylgruppe auf ein organisches Molekül übertragen können. Insbesondere sind dies im Sinne der Erfindung Enzyme, die entweder auf die Orsellin-Säure oder auf die Zucker, vorzugsweisde nach Bildung des Heptasaccharids, eine Methylgruppe übertragen, insbesondere die ORF's aviG2, aviG3, aviG5, aviG6, aviG1, aviG4, aviRa und aviRb, insbesondere aviG4.

Unter <u>Halogenasen</u> versteht man Enzyme, die enzymatisch Halogene auf organische Moleküle übertragen können. Insbesondere sind dies im Sinne der Erfindung Enzyme, die auf die Orsellin-Säure ein, vorzugsweise zwei Cl-Reste an den Positionen R3 und/oder R4 übertragen, insbesondere der ORF aviH.

Entsprechend ist es ein besonders bevorzugter Gegenstand der Erfindung, wenn in Bezug auf das oben genannte Herstellungsverfahren die Sequenz der veränderte/n Nukleinsäure/n vor der Veränderung zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz einer der Sequenzen gemäß laufender Nr. 1, 2-7 oder 48-49 gemäß Tabelle 1 i.V.m. Abb. 1, vorzugsweise einer Sequenz gemäß laufender Nr. 1, 2-7 gemäß Tabelle 1 i.V.m. Abb. 1, insbesondere

einer der Sequenzen gemäß laufender Nr. 1 und/oder 2 gemäß Tabelle 1 i.V.m. Abb. 1, entsprach oder aber mit einer dieser Sequenzen unter mäßig stringenten Bedingungen hybridisierte.

Dabei bedeutet "vor der Veränderung" im Sinne dieser Erfindung, daß die veränderte Nukleinsäure vor der gentechnologischen Manipulation an ihr, d.h. vor der Deletion oder der Veränderung, insbesondere Verkürzung oder Mutation in der Basensequenz, aber auch vor dem Schritt, diese Nukleinsäure/DNA gar nicht erst gentechnologisch in die Wirtszelle einzubringen, die genannte Nukleinsäuresequenz aufweist.

Weiter ist es bevorzugt, wenn in dem die Avilamycin-Derivate definierenden Herstellungsverfahren die Veränderung der Nukleinsäure/n dazu führt, daß das oder die durch die gentechnolgisch veränderte/n Nukleinsäure/n kodierte/n Protein/e oder Polypeptid/e nach der gentechnologischen Veränderung nicht mehr synthetisiert wird/werden.

15

20

Dabei versteht man unter <u>Polypeptid</u> ein Peptid mit zwischen $10 \le \text{und} \le 100$ Aminosäureresten und unter einem <u>Protein</u> ein Makromolekül mit mehr als 100 über Peptidbindungen verknüpften Aminosäureresten. Dabei sind die Proteine im Zusammenhang mit dieser Erfindung vorzugsweise Enzyme. Es fallen aber natürlich auch andere Proteine im Sinne dieser Erfindung unter diesen Begriff.

Die bisher beschriebenen erfindungsgemäßen Avilamycin-Derivate haben überwiegend bzw. alle gegenüber im Stand der Technik beschriebenen verwandten Orthosomycine, insbesondere gegenüber Avilamycin, den Vorteil, hydrophiler zu sein, was therapeutisch erhebliche Vorteile bietet. Das gilt insbesondere für einen Vergleich mit dem Avilamycin A oder C bzw. auch mit dem Everninomycin Ziracin.

Eine Aufgabe der Erfindung war es auch - neben der Bereitstellung neuer Antibiotika – die Biosynthese des Avilamycins aufzuklären, um darauf basierend neue antimikrobielle Substanzen bzw. neue Verfahren zur deren Herstellung zu entwickeln. Ein Kernpunkt war dabei die molekulare Klonierung und die Charakterisierung der an der Avilamycin-Biosynthese beteiligten Gene. Es wurde ein ca. 60 kB großes Stück um die bekannten Gene aviD, aviE1 und aviM sequenziert. Dabei stellte sich heraus, daß die beteiligten Gene in unmittelbarer Nähe voneinander in einem Cluster angeordnet waren. Die Sequenz der einzelnen ORF's sowie deren Anordnung auf dem zentralen Gencluster (laufenden Nr. 1bis 54) sind in Abb. 1 in Verbindung mit Tabelle 1, respektive Abb. 109, dargestellt. Wie bereits ausgeführt waren die Sequenz eines NDP-Glucose-Synthase-Gens (aviD [laufende Nr. 53 gemäß Tabelle 1 i.V.m. Abb. 1]), eines NDP-Glucose-4,6-Dehydratase-Gens (aviE [laufende Nr. 54 gemäß Tabelle 1 i.V.m. Abb. 1]) und eines Polyketid-Synthase-Gens (aviM [laufende Nr. 52 gemäß Tabelle 1 i.V.m. Abb. 1]) ebenso bekannt wie deren vermutliche Funktion als Teil einer iterativen Typ I Polyketid-Synthase zur Bildung von Orsellin-Säure, einem Zwischenprodukt in der Biosynthese von Dichloroisoeverninsäure [Gaisser, S., Trefzer, A., Stockert, S., Kirschning, A., & Bechthold, A. (1997), J Bacteriol. 179, 6271-6278].

10

20

25

30

Die durch die umfangreiche Klonierung entdeckten Sequenzen der an der Synthese des Avilamycins beteilgten übrigen ORF's sind ebenfalls der Abb. 1 zu entnehmen wie auch die relative Anordnung auf dem Gencluster der Abb. 109. Hierbei erlaubt die Angabe der laufenden Nr. aus Tabelle 1 die Zuordnung zur namentlichen Bezeichnung der ORFs. Unter der namentlichen Bezeichnung sind die Sequenzen Abb. 1 zu entnehmen und zwar auf die in der Beschreibung von Abb. 1 dargestellte Weise. Die genaue Klonierungsstrategie sowie weitere Einzelheiten der Sequenzierung sind in den Beispielen dargestellt ebenso wie die funktionelle Analyse und Charakterisierung der gefundenen Gene

(ORF's). Die Zuordnung der ORF-Kürzel zu Funktion und Sequenz (incl. abgeleiteter Proteinsequenz) kann der der Abbildungsbeschreibung folgenden Tabelle 1 entnommen werden.

5

10

15

20

25

30

Ein weiterer wichtiger Gegenstand der Erfindung ist daher eine (oder mehrere) Nukleinsäure(n), die in ihrer Sequenz zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen der laufenden Nummer 1 bis 51 gemäß Tabelle 1 i.V.m. Abb. 1 entspricht/entsprechen oder aber mit einer dieser unter mäßig Sequenzen stringenten Bedingungen hybridisiert. Insbesondere werden auch Sequenzen mit den laufenden Nr. 48 und 49 (gemäß Tabelle 1 und Sequenzdarstellung in Abb. 1) mit Funktion als rRNA-Methyltransferasen (aviRa und aviRb) und auch die Sequenzen mit den laufenden Nr. 50 und 51 (gemäß abelle 1 i.V.m. Abb. 1) mit Funktion als ABC-Transporter-Gene (aviABCI and aviABC2), die Resistenzen gegen Avilamycin vermitteln, bzw. Sequenzen, die zu mindestens 95% diesen Sequenzen mit den vorgenannten laufenden Nr. entsprechen oder aber mit einer dieser Sequenzen unter mäßig stringenten Bedingungen hybridisieren, in der vorliegenden Erfindung beschrieben. Im übrigen auch Mischungen von Nukleinsäuren, die beliebige Unterkombinationen der gemäß Abb. 1 dargestellten Nukleinsäuren mit den laufenden Nr. 1 bis 51 aus Tabelle 1 darstellen, bspw. Mischungen aus zwei, drei, vier, ..., 50 Nukleinsäuren beliebiger in Kombination sind erfindungsgemäß mitoffenbart, ggf. auch als Kombination auf einem Nukleinsäurestrang oder auf verschiedenen Strängen.

Dabei ist/sind insbesondere (eine) Nukleinsäure/n bevorzugt, die zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen mit der laufenden Nr. 1 bis 32 gemäß Tabelle 1 (i.V.m. Abb. 1), vorzugsweise 1 bis 7,

insbesondere 1 oder 2, entspricht/entsprechen oder die aber mit einer dieser Sequenzen unter mäßig stringenten Bedingungen hybridisiert/en.

Ein weiterer Gegenstand der Erfindung sind entsprechend auch Gencluster, die "Open reading frames", vorzugsweise 54, enthalten, die in ihrer Nukleinsäuresequenz zu mindestens 95%, vorzugsweise 97%, insbesondere genau, den Nukleinsäureseguenzen gemäß den Seguenzen mit den laufenden Nummern 1 bis 54 (Tabelle 1 i.V.m. Abb. 1) entsprechen oder aber mit einer dieser Sequenzen unter mäßig stringenten Bedingungen hybridisiert und die auf einem Nukleinsäurestrang oder in beliebiger Kombination auf dem einem oder dem anderen Strang angeordnet sind, vorzugsweise gemäß Abb. 109. Die Gene in einem erfindungsgemäßen Gencluster können 2, drei, vier, ... 50 erfindungsgemäße Gene in beliebiger Strangverteilung und Unterkombination enthalten, insbesondere können die zwischen den ORFs liegenden Abschnitte beliebiger Nukleotidsequenz sein.

Damit ist insbesondere ein Gencluster gemäß Abb. 109 gemeint, aber auch Gencluster, die entsprechende Nukleinsäuren, evt. auch in anderer Anordnung enthalten, wobei bevorzugt – aber nicht notwendig – ist, daß alle ORF's gemäß den laufenden Nummern 1-54 (Tabelle 1 i.V.m. Abb. 1) im Gencluster zu finden sind.

Unter dem Begriff Gencluster versteht man im Sinne dieser Erfindung ein Abschnitt einer DNA, auf dem sich in enger räumlicher Nachbarschaft mehrere Gene befinden. Derartige erfindungsgemäße Gencluster können in einem Vektor vorliegen, bspw. einem BAC oder YAC, einem Cosmid oder Plasmid. Vektoren, die mindenstens eine erfindungsgemäße Sequenz enthalten, sind damit gleichfalls Gegenstand der vorliegenden Erfindung. Erfindungsgemäße Gene können in erfindungsgemäßen

10

15

20

25

Vektoren mit weiteren Signalsequenzen oder weiteren Genen, insbesondere weiteren Antibiotika-Resistenz-Genen, kombiniert werden.

Aus den neu entdeckten Sequenzen der ORF's bzw. Gene ließen sich Protein- und Polypeptidsequenzen ableiten. Entsprechend ist ein weiterer Gegenstand der Erfindung ein Protein oder Polypeptid, das in seiner Aminosäuresequenz zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Aminosäuresequenz gemäß einer der Sequenzen mit den laufenden Nr. 55 – 101 (Tabelle 1 i.V.m. Abb. 1) entspricht.

10

15

20

25

Dabei ist es bevorzugt, wenn das erfindungsgemäße Protein oder Polypeptid zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen mit den laufenden Nr. 55 bis 86 (Tabelle 1 i.V.m. Abb. 1), vorzugsweise 55 bis 61, insbesondere 55 oder 56, entspricht.

Ein weiterer Gegenstand ist entsprechend auch ein Protein oder Polypeptid, das durch eine Nukleinsäure gemäß einem der Ansprüche 12 oder 13 kodiert wird. Dabei versteht man unter "kodieren" im Sinne dieser die Erfinduna. daß Codons (s.o.) des entsprechenden Nukleinsäureabschnitts (Gen oder ORF) für die entsprechende Aminosäuresequenz kodieren, also nach Transkription und Translation ein entsprechendes Protein oder Polypeptid mit dieser Aminosäuresequenz entsteht.

Insbesondere sind die erfindungsgemäßen Proteine Enzyme, bzw. Teil eines Multienzymkomplexes. Sie können aber natürlich auch andere Funktionen haben.

Da zum einen die erfindungsgemäßen Avilamycin-Derivate über ein gentechnologisches bzw. biotechnologisches Verfahren definiert sind oder dadurch hergestellt werden, auf der anderen Seite die neu entdeckten Gene bzw. Proteine (Enzyme) in gen- bzw. biotechnologischen Verfahren zur Herstellung entsprechender Antibiotika eingesetzt werden können, haben im Rahmen dieser Erfindung nahezu zwangsläufig gentechnologisch veränderte Zellen eine wichtige Funktion.

Ein weiterer Gegenstand dieser Erfindung sind daher gentechnologisch veränderte Zelle enthaltend mindestens eine nicht-endogene erfindungsgemäße Nukleinsäure. einen nicht-endogenen erfindungsgemäßen Gencluster und/oder ein nicht-endogenes erfindungsgemäßes Protein oder Polypeptid.

10

15

20

25

30

verändert oder deletiert wurde.

Ebenso ist eine Zelle ein weiterer Gegenstand der Erfindung, die mindestens eine gentechnologisch veränderte Nukleinsäure, deren Sequenz vor der Veränderung zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen mit der laufenden Nr. 1 bis 54 (Tabelle 1 i.V.m. Abb.1) entsprach oder aber die mit einer dieser Sequenzen unter mäßig stringenten Bedingungen hybridisierte, enthält.

Ein besonders bevorzugter Gegenstand der Erfindung ist eine Zelle vom Typ *Streptomyces viridochromogenes*, vorzugsweise vom Subtyp Tü57, bei dem mindestens eine der Nukleinsäuren mit einer Sequenz mit einer der laufenden Nr. 1-54 (Tabelle 1 i.V.m. Abb. 1) gentechnologisch verändert oder deletiert wurde. Dabei ist es besonders bevorzugt, wenn in der entsprechenden Zelle mindestens eine der Nukleinsäuren mit einer Sequenz mit einer laufenden Nr. 1, 2-7 oder 48-49 (Tabelle 1 i.V.m. Abb. 1), vorzugsweise 1 oder 2-7, insbesondere 1 und/oder 2 gentechnologisch

Gemäß obigen Ausführungen ist entsprechend ein weiterer Gegenstand der Erfindung die Verwendung einer erfindungsgemäßen Nukleinsäure, eines erfindungsgemäßen Genclusters, eines erfindungsgemäßen Proteins oder Polypeptids und/oder einer der erfindungsgemäßen Zellen zur Herstellung eines Avilamycin-Derivats, vorzugsweise eines erfindungsgemäßen Avilamycin-Derivats.

Ein weiterer Gegenstand der Erfindung ist ein Verfahren zur Herstellung erfindungsgemäßer Avilamycin-Derivate mit folgenden Schritten:

- (1) in einer kultivierbaren Zelle, die die nötigen Gene bzw. Enzyme zur Synthese des Orthosomycin-Grundkörpers bestehend aus
 - (a) einem endständigen Dichloroisoeverninsäure-Rest (A in Formel I) und
 - (b) einem damit veresterten, über normale Esterbindung und Orthoesterbindungen verknüpften Heptasaccharid (B bis H in Formel I) aus:

(i) zwei D-Olivose-Resten (B und C)

- (ii) einem 2-Desoxy-D-Evalose-Rest (D),
- (iii) einem D-Fucose (E),
- (iv) einem D-Mannose-Rest (F),
- (v) einem L-Lyxose-Rest (G) und
- (vi) einem (Methyl-)Eurekanat Rest (H)

aufweist, wird mindestens eine Nukleinsäure, deren Sequenz zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz mit einer der laufenden Nr. 1 bis 54 gemäß Tabelle 1 i.V.m. Abb. 1 entspricht oder aber eine

15

10

20

25

Nukleinsäure, die mit einer dieser Sequenzen unter mäßig stringenten Bedingungen hybridisiert, gentechnologisch verändert, deletiert oder nicht exprimiert,

- 5
- (2) die so gentechnologisch veränderte Zelle wird kultiviert,
- (3) der Kulturüberstand wird gewonnen,
- (4) der Kulturüberstand wird aufgearbeitet und dabei das oder die entstandene/n Avilamycin-Derivat/e aufgereinigt und isoliert,
- (5) gegebenenfalls werden unterschiedliche Derivate getrennt.

10

15

20

25

30

Es ist bevorzugt, wenn bei diesem Verfahren die kultivierbare Zelle ausgewählt ist aus einer Zelle vom Typ Streptomyces viridochromogenes oder einer Zelle, die mit Ausnahme der gentechnologisch veränderten, deletierten oder nicht exprimierten Nukleinsäure die Nukleinsäuren gemäß laufenden Nr. 1-54 gemäß Tabelle 1 i.V.m. Abb. 1 bzw. dazu zu mindestens 95%, vorzugsweise 97 %, homologe Nukleinsäuren oder aber mit diesen Sequenzen hybridisierende Sequenzen enthält oder den erfindungsgemäßen Gencluster enthält. Letzteres wird in der Fachliteratur als heterologe Expression bezeichnet. Dabei ist es besonders bevorzugt, wenn die Zelle ausgewählt ist aus einer Zelle vom Typ Streptomyces viridochromogenes, Streptomyces Lividans, Streptomyces albus oder Streptomyces fradiae, insbesondere einer Zelle vom Typ Streptomyces viridochromogenes Tü 57 oder A 23575.

711 . . .

Auch eine alternative Verfahrensführung kommt erfindungsgemäß in Betracht. Hierbei wird nach Durchführung der Verfahrensschritte (1) und (2) jedoch das Avialmycin-Derivat nicht aus dem Kulturüberstand gewonnen, sondern dieses akkumuliert sich vielmehr in den Wirtszellen. Gemäß dem alternativen Verfahren werden daher in Verfahrensschritt (3) die Wirtszellen geerntet, nachfolgend aufgeschlossen und die Avilamycin-Derivate von den übrigen Zellbestandteilen getrennt und schließlich

aufgereinigt. Zur Trennung und Aufreinigung können die vorgenannten und alle dem Fachmann geläufigen Verfahren zum Einsatz kommen.

Weiter bevorzugt ist es, wenn bei dem erfindungsgemäßen Verfahren die veränderte/n Nukleinsäure/n für eine Methyltransferase und/oder für eine Halogenase kodiert/en. Dabei ist es besonders bevorzugt, wenn die Sequenz der veränderte/n Nukleinsäure/n vor der Veränderung zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz einer der Sequenzen mit den laufenden Nr. 1, 2-7 oder 48-49 gemäß Tabelle 1 i.V.m. Abb. 1, vorzugsweise einer Sequenzen mit den laufenden Nr. 1 oder 2-7 gemäß Tabelle 1 i.V.m. Abb. 1, insbesondere einer der Sequenzen mit den laufenden Nr. 1 und/oder 2 gemäß Tabelle 1 i.V.m. Abb. 1, entsprach.

Weiter bevorzugt ist es, wenn bei dem erfindungsgemäßen Verfahren die Veränderung der Nukleinsäure/n, insbesondere von erfindungsgemäßen Methyltransferasen und/oder Halogenasen, dazu führt, daß das oder die durch die gentechnolgisch veränderte/n Nukleinsäure/n kodierte/n Protein/e oder Polypeptid/e nach der gentechnologischen Veränderung nicht mehr synthetisiert wird/werden.

Die erfindungsgemäßen Avilamycin-Derivate sind prinzipiell toxikologisch unbedenklich, so daß sie sich als pharmazeutischer Wirkstoff in Arzneimitteln eignen. Ein weiterer Gegenstand der Erfindung sind daher Arzneimittel enthaltend mindestens ein erfindungsgemäßes Avilamycin-Derivat, vorzugsweise mindestens zwei, insbesondere auch Mischungen von einem oder mehreren Avilamycin-Derivaten mit mindestens einem weiteren Antibiotikum aus dem Stand der Technik, bspw. Vancomycin, Penicillin, Streptomycin, Neomycin, Kanamycin, Sisomycin, Amikacin und/oder Tobramycin, sowie gegebenenfalls geeignete Zusatz- und/oder Hilfsstoffe. Auch andere bakteriostatische oder bakterizide Substanzen

10

25

können mit erfindungsgemäßen Substanzen kombiniert werden, bspw. Cephalosporine, Chloramphenicol, Ethambutol, Cephalosporine, Isonicotinamide, Tetracycline, Sulfonamide, Oxalactame (bspw. Flomoxef, Clavulansäure) und/oder Nitrofurane.

5

10

15

Darunter versteht man insbesondere auch Trägermaterialien, Füllstoffe, Lösungsmittel, Verdünnungsmittel, Farbstoffe und/oder Bindemittel. Die Arzneimittel Arzneiformen können als flüssige in Form Injektionslösungen, Tropfen oder Säften, als halbfeste Arzneiformen in Form von Granulaten, Tabletten, Pellets, Patches, Kapseln, Pflaster oder Aerosolen verabreicht werden. Die Auswahl der Hilfsstoffe etc. sowie die einzusetzenden Mengen derselben hängen davon ab, ob das Arzneimittel oral, peroral. parenteral. intravenös, intraperitoneal, intradermal, intramuskulär, intranasal, buccal, rektal oder örtlich, zum Beispiel auf die Haut, die Schleimhäute oder in die Augen, appliziert werden soll. Für die orale Applikation eignen sich Zubereitungen in Form von Tabletten, Dragees, Kapseln, Granulaten, Tropfen, Säften und Sirupen, für die parenterale, topische und inhalative Applikation Lösungen, Suspensionen, leicht rekonstituierbare Trockenzubereitungen sowie Sprays.

20

Oral oder perkutan anwendbare Zubereitungsformen können die erfindungsgemäßen Avilamycin-Derivate verzögert freisetzen und so einen gleichmäßigeren Plasmaspiegel erreichen. Prinzipiell können den erfindungsgemäßen Arzneimitteln andere dem Fachmann bekannte weitere Wirkstoffe zugesetzt werden.

25

Die an den Patienten zu verabreichende Wirkstoffmenge variiert in Abhängigkeit vom Gewicht des Patienten, von der Applikationsart, der Indikation und dem Schweregrad der Erkrankung. Üblicherweise werden 0,005 bis 1000 mg/kg, bevorzugt 0,05 bis 5 mg/kg wenigstens eines erfindungsgemäßen Avilamycin-Derivats appliziert.

Da für die erfindungsgemäßen Avilamycin-Derivate eine antibiotische Wirkung nachgewiesen ist, eignen sie sich natürlich prinzipiell zur Behandlung von Erkrankungen, insbesondere zur Behandlung von Infektionskrankheiten, bzw. zur Herstellung eines arzneimittels zur Behandlung derartiger Erkrankungen. Ein weiterer Gegenstand der Erfindung ist entsprechend die Verwendung eines erfindungsgemäßen Avilamycin-Drivats zur Herstellung eines Arzneimittel mit antibiotischer Wirkung zur Behandlung von bspw. Infektionskrankheiten. Infektionserkrankungen werden Erkrankungen Verstanden, denen eine Infektion mit einem viralen. einem bakteriellen oder protozoologischen Erreger zugrundeliegt. Damit sind die vorliegenden erfindungsgemäßen Antibiotika auch zur Behandlung von Mykosen, insbesondere kutanen und subkutanen Mykosen, geeignet.

Bevorzugt werden die erfindungsgemäßen Avilamycin-Derivate jedoch zur Bekämpfung bakterieller Infektionen eingesetzt. Insbesondere sind Infektionen mit den folgenden Erregern zu nennen: Leprabakterien, Mvkobakterien. Neisserien. Tuberkulosebakterien, Aktinomyceten, Corynebakterien, Listerien. Clostridien, Bazillen, Enterokokken, Streptokokken, Staphylokokken, insbesondere auch zur Behandlung von Infektionen mit Staphylococcus aureus Stämmen, Rickettsien, Chlamydien, Mykoplasmen, Borrelien. Spirochäten, Brucellen. Bortedellen, Pseudomonaden, Helicobacter, Hämophilus, Vibrionen, Shigellen, Yersinia, Salmonellen und weitere unter die Familie der Enterobacteriaceae fallende Vertreter. Entsprechend die werden erfindungsgemäßen Substanzen zur Behandlung aller klinischen Krankheitsbilder, die durch bspw. die vorgenannten Bakterienstämme verursacht werden. verwendet. Beispielhaft seien die folgenden

10

15

20

25

Krankheitsbilder genannt: Tuberkulose; Pneumonien; Typhus; Paratyphus; Lues; Gastritis; Gastroenteritis; Ruhr; Pest; Enteritis; extraintestinale Infekte, Peritonitis und Appendizitis mit E. coli sowie intestinale Infekte mit EHEC, EPEC, ETEC oder EIEC; Cholera, Legionärskrankheit, Keuchhusten, Brucellosen, Lyme-Borreliose, Leptospirose, Fleckfieber, Trachom, Gonorrhoen, Meningitis, Septikämie, Lepra etc.

Ein weiterer Gegenstand des Verfahrens ist auch die Behandlung eines Menschen oder Tieres, der oder das diese Behandlung benötigt, mit einem erfindungsgemäßen Avilamycin-Derivat, vorzugsweise bei Infektionskrankheiten, insbesondere unter Beteiligung von Staphylococcus aureus.

Im folgenden Abschnitt wird die Erfindung weiter durch Beispiele erläutert, ohne sie darauf zu beschränken.

Beispiele und Abbildungen:

20 Abbildungen:

Abbildung 1 zeigt die Sequenz des gesamten Genclusters mit seinen 54 Nuleinsäuresequenzen der ORF's aus Streptomyces viridochromogenes Tü 57. In Abbildung 1 sind die Kurzbezeichnungen der entsprechenden Nukleinsäuresequenzen enthalten, wobei diese Kurzbezeichnungen (ohne das Präfix "Avi") jeweils an den Zeilen eingefügt sind, die die Startcodons der 54 Sequenzen aufweisen. Die AS, die durch das jeweilige Startcodon codiert wird, ist eingekreist. Der an diesen Stellen jeweils eingezeichnete Pfeil gibt die Leserichtung (rückwärts oder vorwärts) der Gene mit dem Startcodon als Ausgangspunkt wieder.

5

10

Abb. 1 enthält die Nukleotidsequenzen der beiden komplementären DNA-Stränge ebenso wie die (tw. fiktiven) AS-Sequenzen für beide Stränge in allen drei Leserastern, insgsamt also 2 Nukleotidsequenzen und die sich hieraus potentiell ergebenden 6 Proteinsequenzen (Ein-Buchstaben-Die drei Proteinsequenzen des oberen Nukleotidstrangs sind Code). oberhalb der dazugehörigen Nukleotidsequenz, die drei Proteinsequenzen des unteren komplementären Nukleotidsequenz unterhalb dazugehörigen unteren Nukleotidstrangs eingezeichnet. Die 54 namentlich in Abb. 1 eingezeichneten Proteinsequenzen im Gencluster ergeben sich aus Abb. 1 dadurch, daß eine eingekreiste AS als Ausgangspunkt gewählt wird und dann in diesem Leseraster, d.h. in der entsprechenden Zeile (bspw. 2. Zeile unterhalb der unteren Nukleotidsequenz), die AS-Sequenz in der durch die Pfeile angegebenen Richtung, also im folgenden entweder vorwärts oder rückwärts, abgelesen wird. Die Sequenz endet mit dem Stop-Codon im entsprechenden Leseraster, wobei Stop-Codons durch ein "Stern"-Symbol in der enrsprechenden Zeile markiert sind.

Die zur AS eines ORFs gehörige Nukleotidsequenz ergibt sich durch das entsprechende oberhalb oder unterhalb (für den oberen Strang) befindliche Triplett. Die Ein-Buchstaben-Bezeichnung der Aminosäure ist dabei jeweils so angeordnet, daß sie oberhalb oder unterhalb des mittleren Nukleotids des für diese AS codierenden Codons liegt.

In der nachfolgenden Tabelle sind die namentlichen Bezeichnungen der 54 codierenden Bereichen im Gencluster jeweils laufenden Nummern zugeordnet, wobei die laufenden Nummern 1 bis 54 die Nukleotidsequenzen angeben und die laufenden Nummern 55 bis 108 den jeweils dazu gehörigen AS-Sequenzen entsprechen, und zwar codiert die Nukleotidsequenz mit der laufenden Nummer 1 für die AS mit der laufenden Nummer 2 für die AS mit der laufenden Nummer 56 etc.

Allgemeine Methoden und Materialien:

a)

Bakterienstämme, Plasmide und Kulturbedingungen.

10

15

20

Streptomyces viridochromogenes Tü57 wurde mit 1 % Malzextrakt, 0.4 % Hefeextrakt, 0.4 % Glucose and 1 mM CaCl₂, bei einem pH von 7.2 (HA medium) bei 37°C kultiviert. Zur Herstellung von Avilamycin wurden Streptomyces viridochromogenes Tü57 und alle Mutatnten in NL19+-Medium, das 2% D-Mannitol, 2% Sojamehl und 20 mM L-Valin enthielt und auf pH 7.5 eingstellt war, kultiviert. Für die DNA-Manipulation wurde Escherichia coli XL-1 Blue MRF' (Stratagene) als Wirtszelle benutzt. Vor der Transformation von S. viridochromogenes Tü57 wurden die Plasmide in E. coli ET 12567 (dam~, dcm~, hsdS, Cm^R) gezogen, um unmethylierte DNA zu erhalten. E. coli Stämme wurden auf Luria-Bertani (LB) agar oder flüssigem Medium, das das geeignete Antibiotikum enthielt, kultiviert.

b)

25 <u>Allgemeine gentechnologische Manipulationen, PCR and DNA</u> <u>Sequenzierung / Sequenz-Analysis</u>

Es wurden Standard-Methoden der Molekularbiologie - wie dem Fachmann bekannt - durchgeführt. Die Isolierung von E.coli plasmid DNA, DNA Restriktion, DNA Modifizierung wie das "filling-in sticky ends" und die "Southern"-Hybridisierung wurden gemäß den Protokollen der Hersteller der Kits, Enzyme und Reagentien durchgeführt (Amersham-Pharmacia, Boehringer Mannheim, Promega, Stratagene). Streptomyces Protoplastenbildung, -transformation, and -protoplast Regenerierung wurden wie üblich durchgeführt. Die PCR wurde mit einem Perkin Elmer GeneAmp 2400 thermal cycler durchgeführt, wobei die Bedingungen so wie beschrieben und üblich waren. Die verwendeten Oligonukleotid-Primer waren:

AviG4F (5'-GGACGCCTATCTGTGCCACCCCTTCCTGGT-3'),

AviG4R (5,-TGAGCGCTCGCCTAGACAGAATCATCTCCC3'),

S2A (5'-GCGTCCATCTTGCCGGGA-3') und

S2B (5,-CGTGGATCCCGCCGGCCC-3').

10

20

25

30

Die Nukleotidsequenzierung wurde mit der Dideoxy-Kettenabruchsmethode unter Verwendung eines automatischen Laser-Fluorescenz-Sequencers (Perkin Elmer ABI) durchgeführt. Die Sequenzierungs-Reaktionen wurden mit einem Thermosequenase-Cycle-Sequencing Kit with 7-deaza-dGTP (Amersham) and Standard-Primerns (M 13 universal and reverse, T3, T7) durchgeführt. Mit dem DNASIS-Software-Packet (version 2.1, 1995; Hitachi Software Engineering) wurde computerunterstützte Sequenz-Analyse und die Datenbank-Recherche mit dem BLAST 2.0 program auf dem Server des National Center for Biotechnology Information, Bethesda MD, USA, durchgeführt. Die vorgelegten Sequenzen sind in der Genbank-Datenbank unter der Zugangsnummer ("Accession Number") AF333038 abgelegt.

c)

Konstruktion eines Gen-inaktivierenden Plasmids

aviG4: Eine einmal vorkommende Ncol-Restriktionsschnittstelle im Gen aviG4 (laufende Nr. 2, Abb. 1), die auf dem 1.9 Fragment liegt, das in die Sacl and EcoRl Schnittstellen von pBSK- ligiert ist, wurde für die gezielte Inaktivierung durch ein Verschieben des Leserahmens ausgewählt. Das 1.9 kb Fragment wurde mit Sacl and Kpnl verdaut und wurde in das Genlnaktivierungsplasmid pSP 1 hinein ligiert. Nach dem Restriktionsverdau mit Ncol, Behandlung mir dem Klenow -Fragment der E. coli DNA-polymerase 1 and erneuter Ligation wurde die beabsichtigte Veränderung durch DNA-Sequenzierung bestätigt. Das gebildete Plasmid wurde als pMIKG4E3 bezeichnet.

15

20

10

aviH: Die einmal vorkommende Narl Schnittstelle im aviH-Gen, das auf dem 3.7 kb Sacl-Fragment ligiert in pBSK- vorliegt, wurde durch Narl-Restriktionsverdau und anschließender Behandlung wie für aviG4 beschrieben, verändert. Die Sequenzierung verschiedener Plasmide zeigte die korrekte Veränderung. Das 3.7 kb-Fragment wurde in pSP1 kloniert, um das Gen-Inkativierungs-Plasmid pSP 1S2Nar zu bilden.

d)

Analyse neuer Avilamycin A-Derivate

25 TLC Analysis

Streptomyces viridochromogenes Tü57 und die Mutanten GW-4 und GW4-AM1 wurden drei Tage lang inkubiert. Die Kulturen wurden abfiltriert und das Filtrat auf eine Festphasen Extraktions-Patrone aufgetragen

(SepPakC₁₈, Waters). Die Patrone wurde mit einem Gradienten zwischen 10 % und 100% Methanol in Wasser eluiert. Avilamycin-Derivate eluieren mit der Fraktion, die 60-70 % Methanol enthält. Nach einer Extraktion mit Ethyl-Acetat und Abziehen des Lösungsmittels wurden die Avilamycin-Derivate wieder in Methanol gelöst und mit TLC auf Silicagel-Platten (silica gel 60 F254, Merck) mit Methylenchlorid/Methanol (9:1, v/v) als Lösungsmittel gemessen. Avilamycin-Derivate waren nach Behandlung mit Anisaldehyd/H₂S0₄ detektiert worden.

10 **e)**

HPLC-UV-Analyse

Eine analytische HPLC-UV wurde auf einem Hewlett Packard 1090 Liquid Chromatograph mit einem Photodioden-Array-Detektor und einer HP-ODS-Hypersil 5Mm, 200 x 2 mm Säule durchgeführt. Die Meßwellenlänge betrug 210 nm. Die Abfolge der Lösungen war wie folgt: Lösung A, 0.04M (NH₄)₂HPO₄ pH 7.0 Puffer; Lösung B, 100% Methanol; ein nichtlinearer Gradient, mit 30-62% der Lösung B über 25min bei einer Flußrate von 0.2ml/min verteilt.

20

25

15

.f)

HPLC-MS-Analyse

Für die HPLC-MS-Aanalyse wurden die Avilamycin-Derivate auf einer HPLC-Anlage (HP 1110, Hewlett-Packard, Waldbronn) mit einer HP ODS Hypersil C₁₈ Säule (2.1 by 100 mm; 5 μm) bei einer Flußrate von 0.1 ml/min, Detektion bei 220 nm und dem folgenden Gradienten laufen gelassen: 0-5 min von 0 % bis 20 % B, 5.1-120 min bis 90 % B (Lösung A, H₂0 : MeOH 3:2; Lösung B, MeOH). Massenspektren wurden auf einem

Bruker Esquire-LC 1.6n Massenspektrometer (Bruker Daltonik, Bremen) mit einer Elektrospray (ES) Ionenquelle (positive ion mode) aufgezeichnet. Die Meßbreite betrug zwischen 200 - 1800 m/z.

5 **g**)

GC-MS-Analyse

Eine Analyse der neuen Gavibamycin-Derivate (erfindungsgemäßen Avilamycin-Derivate), die durch die mutierte Zelle Streptomyces viridochromogenes GW4 synthetisiert worden waren, wurde nach Etylierung mit GC-MS-Analyse durchgeführt. Die Derivate wurden in einer Mischung aus DMSO und Acetonitril (3:40) gelöst. Nach Zugabe von Ethyliodid and K_2CO_3 lief die Reaktion über Nacht ab. Nach Abziehen des Lösungsmittels wurden die Derivate mit HCl/Methanol bei 115^{0} C für 15 min hydrolisiert. Nach Abziehen des Lösungsmittels wurden die Derivate mit Diethylether extrahiert und mit GC-MS analysiert. Ein Hewlett Packard 5973 MSD System wurde verwendet um El (electron impact) Spektren (Säule: SE54, $12m \times 0.25mm$; $d_f = 0.125\mu$). Die Säulentemperatur wurde wie folgt programmiert: 50^{0} C für 2 min; 25^{0} C/min bis 100^{0} C; 5^{0} C/min bis 250^{0} C.

Beispiel 2:

Klonierung und Sequenzierung des Avilamycin Clusters

25

15

Ein 60kb Abschnitt des Chromosoms des S. viridochromogenes Tü57, das Gene enthält, die an der Biosynthese von Avilamycin beteiligt sind, wurde kloniert und sequenziert. Eine Analyse der DNA-Sequenz ergab 54 "open reading frames". Es war bereits bekannt, daß das NDP-Glucose 4,6-

Dehydratase Gen aviE und das Orsellinsäure Synthase-Gen aviM essentiell für die Biosynthese von Avilamycin A sind. Es wurde die DNA, die die aviE und aviM-Gene flankiert, isoliert und sequenziert, um den biosynthetischen Avilamycin-Gencluster zu identifizieren. Ein 17.6 kb Stück upstream von aviM und ein 35.9 kb Stück downstream von aviE wurden sequenziert. Die sequenzierten Gene und ihre Funktion sind Tabelle 1 zu entnehmen. Abb. 109 zeigt die genetische Anordnung des biosynthetischen Avilamycin-Genclusters. Der Cluster wird durch ein Avilamycin-Resistenz-Gen (aviRb) und einem Desoxyzucker-Synthese-Gen (aviZ2) flankiert. Im Zentrum des sequenzierten Abschnitts sind 25 Gene (aviX10- aviGT4), die alle in gleicher Richtung transkribiert werden.

Beispiel 3:

Analyse der ORF's

15

10

a) Allgemein

Es wurde eine Computeranalyse der gefundenen Sequenzen der ORF's durchgeführt. Überwiegend wurden die Ergebnisse eines Sequenzvergleichs mit den Kenntnissen über die Biosynthese des Avilamycins in Verbindung gesetzt. Die Ergebnisse dieser auf die vorliegenden Experimente gestützten Überlegungen sind in Tabelle 1 abzulesen.

Im folgenden werden die funktionellen Überlegungen an ausgewählten
25 Beispielen, insbesondere den Methyltransferasen und Halogenasen vorgestellt.

b)

Gene mit iner Funktion in d r Biosynth se v n
30 Dichloroiso verninsäure

AviM ist für die Bildung von Orsellinsäure während der Avilamycin-Biosynthese verantwortlich. AviN, das upstream von aviM liegt, dürfte für ein Enzym, das das Startsignal für Orsellinsäure-Synthese kontrolliert, kodieren. Da die Biosynthese von Dichloroisoeverninsäure (A in Formel I) ausgehend von Orsellinsäure Methylierung und Di-Halogenierung voraussetzt, wurde vermutet, daß AviG4, das DmpM, einer O-Demethylpuromycin-O-Methyltransferase aus S. alboniger identische AS) ähnelt, und AviH, die PltA, einer Halogenase aus Pseudomonas fluorescens Pf-5, die an der Pyoluteorinbiosynthese (39% identische AS) beteiligt ist, ähnelt, für die Modifizierung der Orsellinsäure verantwortlich sind.

c)

10

Gene mit einer Funktion in der Bioynthese von Desoxy-Zuckern.

2-Deoxy-D-Evalose unterscheidet sich von **D-Olivose** in einer Methylgruppe an C3-Position. Es ist anzunehmen, daß dNDP-4-keto-2,6-Didesoxy-D-Glucose ein wichtiges Zwischenprodukt in der Biosynthese dieses methylierten Desoxyzuckers ist. Methylierung durch AviG1, das TylCIII ähnelt, einer 3C-Methyltransferase aus S. fradiae (54% identische AS), und Ketoreduktion durch entweder AviZl1oder AviZ2, die beide Ketoreduktasen and Oxidoreduktasen ähneln, komplettieren Biosynthese.

25

20

d)

Gene mit einer Funktion in der Modifikation der Heptasaccharid-Kette

Neben aviGI. aviG4. aviRa and aviRb wurden vier weitere

Methyltransferase-Gene im Cluster gefunden (aviG2, aviG3, aviG5 und aviG6). Sie wurden dadurch als potentielle Methyltransferase-Gene identifiziert, daß entweder ihr Produkt Methyltransferasen aus anderen Organismen ähnelt, oder daß sie Motive enthalten, die typischerweise in verschiedenen methylierenden Proteinen gefunden werden. Es wurden von einer erfindungsgemäßen Zellinie verschiedene Avilamycin-Derivate, die keine Methylgruppe an verschiedenen Positionen im Molekül enthielten, produziert. Das weist darauf hin, daß die Methylierung zu einem sehr späten Zeitpunkt der Biosynthese erfolgt. AviG2, AviG3, AviG5 und AviG6 dürften am D-Fucose-Rest (E), D-Mannose-Rest (F) und am Methyl-Eurekanat-Rest (H) von Avilamycin A methylieren.

Beispiel 4:

Herstellung einer aviG4-Gen Substitutionsmutante

15

20

25

30

10 .

Zur Inaktivierung von aviG4 wurde das Plasmid pMIKG4E3 konstruiert (s. Beispiel 1), um den Ersatz des Wildtyp-Gens durch ein mutiertes Allel zu erlauben. Nach Bildung von Protoplasten und Transformation von S. viridochromogenes mit dem Plasmid pMIKG4E3, wurden Erythromycin resistente Kolonien erhalten. Die Transformationseffektivität war ungefähr 10 Kolonien pro µg Plasmid-DNA. Mehrere Kolonien wurden ohne Erythromycin auf Platten kultiviert, um nach dem Verlust der Rsistenz zu selektieren. Verschiedene sensitive Kolonien wurden erhalten, was darauf hindeutet, daß es sich um die Folge eines "double cross-over" handelt. Zwei Mutanten, G4/24/20 und G4/24/30, wurden weiter untersucht. PCR-Fragmente, die unter Benutzung der Primer aviG4F- und aviG4R-DNA von G4/24/20 und G4/24/30 amplifiziert wurden, konnten nicht von Ncol geschnitten werden, während PCR-Fragmente aus Wildtyp-DNA von diesem Enzym geschnitten werden konnten. Um die Deletion in aviG4 nachzuweisen wurden wie folgt Southem-Blot-Analysen durchgeführt.

Ncol-geschnittene, chromosomale DNA wurde aus G4/24/20 und G4/24/30 gewonnen. Als diese DNA mit einem 1.9 kb-Fragment, das das ganze *aviG4*-Gen enthielt, hybridisiert wurde, wurde ein 11 kb-Fragment detektiert, während die zu erwartenden 5 kb- and 6 kb-Fragmente in der S. *viridochromogenes* Tü57 Linie gefunden wurden (Abb. 110). Die Mutante G4/24/30 wurde unter dem neuen Namen S. *viridochromogenes* GW4 für weitere Experimente genutzt.

Beispiel 5

5

15

20

25

Herstellung einer aviG4-- aviH Doppelgen-Ersatz-Mutante

Das Plasmid pSP 1 S2Nar wurde entwickelt, um das aviH-Gen auszuschalten (s. Beispiel 1). S. viridochromogenes GW4 Protoplasten wurden mit diesem Plasmid transformiert. Es traten ca. 20 erythromycin-resistente Kolonien pro µg DNA auf. Einige davon wurden zum Screening, ob die Erythromycin-Resistenz verloren geht (was ein "double-cross-over" anzeigt), kultiviert. Die Mutante GW4-AM1 wurde für weitere Experimente ausgewählt. Ein 1.34 kb PCR-Fragment, das unter Verwendung der Primer S2A und S2B aus H/3/16 gewonnen wurde, konnte von Narl nicht geschnitten werden, während das PCR-Fragment aus GW4 vom Enzym verdaut wurde. Um die Deletion in aviH nachzuweisen wurde eine Southern-Blot-Analyse durchgeführt. Chromosomale DNA aus H/3/16 wurde mit Narl geschnitten und mit einer 3,7 kb Sonde, die das aviH-Gen enthielt, hybridisiert. Es wurde ein 5.7 kb-Fragment detektiert, während bei chromosomaler DNA aus GW4 die Fragment erwartungsgemäß bei 4.3 kb und 1.4 kb lagen (nicht gezeigt).

Beispiel 6:

Vervollständigung von S. viridochromogenes GW4 and S.

virid chromogen s GW4-AM1

Um klar zu überprüfen, ob die Mutation nur die gewünschten und keine anderen Gene betrifft, wurden aviG4 und aviH hinter dem ermE-up promoter ligiert, in das Integrationsplasmid pSET152 einkloniert und durch Protoplasten-Transformation in die entsprechenden Mutanten eingeführt. Die Production von Avilamycin bzw. Gavibamycin wurde wieder hergestellt. Damit ist jede Art von "upstream"- oder "downstream"-Effekt auszuschliessen.

15

20

25

30

Beispiel 7:

Analyse der neugebildeten Avilamycin-Derivate durch S. viridochromogenes GW4 und S. viridochromogenes GW4-AM1

Avilamycin A (M+Na: 1425) und Avilamycin C (M+Na: 1427) wurden in Extrakten von S. viridochromogenes Tü57 durch Flüssigchromatographie (LC)-Masenspektrometrie-Analyse nachgewiesen. Avilamycin C war die Hauptkomponente. Messung bei hoher Auflösung zeigte, daß beide Verbindungen 2 Chloratome enthalten, die an ihem typischen Isotopenmuster erkannt werden können. Die Masse der zwei durch S. viridochromogenes GW4 gebildeten Hauptverbindungen war 1411 (M+Na) and 1413 (M+Na) (Abb. 111) was zeigt, daß aviG4 wirklich für eine Methyltransferase kodiert. Die Hauptprodukte der Mutante GW4 wurden isoliert, durch Behandlung mit Ethyliodid ethyliert und unter Verwendung von Methanol and Salzsäure hydrolysiert. Die Reaktionsprodukte wurden durch GC-MS analysiert. Das Massenspektren dieser Probe zeigten mehrere Peaks (Abb. 112). Der Peak by m/z 436 entspricht dem D-Olivosylester der Dichloro-di-O-ethyl-orsellinsäure und die meisten weiteren Peaks (m/z 405, m/z 275, m/z 247) entsprachen Fragmenten, die vom Orsellinsäure-Rest ausgehen (Abb. 112). Das legt den Schluß nahe,

daß die Differenz zwischen Avilamycin A (C) und dem neuen Derivat, Gavibamycin A1 (A3), aus einer Veränderung der Struktur des Orsellinsäure-Rests resultiert.

Gavibamycin A1 und A3 entsprechen der allgemeinen Formel I mit der folgenden Bedeutung für die Reste R1-R8:

Nr.	R1	R2	R3	R4	R5	R6	R7	R8
A1	COCH(CH ₃) ₂	COCH ₃	ОН	CI	CI	CH ₃	CH ₃	OCH ₃
_A3	COCH(CH ₃) ₂	CH(OH)CH ₃	ОН	CI	CI	CH₃	CH ₃	OCH ₃

S. viridochromogenes GW4-AM1 wurde auch durch HPLC-MS analysiert. Die Masse der zwei Haupt-Avilamycin-Derivate war 1343 (M+Na) und 1345 (M+Na). Bei einem Vergleich des Isotopenmusters der Haupt-Derivate aus der Mutante GW4 zeigte das Isotopenmuster der Hauptprodukte der Mutante GW4-AM1 keine spezifischen Signale für Chloridionen (Abb. 111), was darauf hindeutet, daß die Inaktivierung von aviH zum Verlust beider Chlorid-Atome führt. Die neuen Derivate wurden Gavibamycin B 1 (Avilamycin A-Analogon) und Gavibamycin B3 (Avilamycin C-Analogon) genannt.

Gavibamycin B1 und B3 entsprechen der allgemeinen Formel I mit der folgenden Bedeutung für die Reste R1-R8:

Nr.	R1	R2	R3	R4	R5	R6	R7	R8
B1	COCH(CH ₃) ₂	COCH ₃	ОН	H	Н	CH₃	CH₃	OCH ₃
B3	COCH(CH ₃) ₂	CH(OH)CH ₃	ОН	Н	Н	CH ₃	CH ₃	OCH ₃

Beispi 18:

10

Biologische Eig nschaften von Gavibamycin A3

Das antimikrobielle Spectrum von Gavibamycin A3 wurde bestimmt und mit dem von Avilamycin A verglichen. Dabei wurde die "brothmicrodilution"-Methode gemäß den Vorschriften des nationalen Kommittees für klinische Labor-Standards angewandt. Beide Metaboliten zeigten antibiotische Aktivität gegen Bacillus subtilis, Staphylococcus aureus ATCC6538, Staphylococcus aureus ATCC6538P, Staphylococcus aureus ATCC29213, Staphylococcus aureus Q48-1.2.1, Enterococcus faecalis ATCC29212, Enterococcus faecalis H-7-6 and Streptococcus pneumoniae ATCC49619.

Erste Tests zeigen weiter, daß Gavibamycin A3 etwas aktiver gegen verschiedene *Staphylococcus aureus* Stämme ist als Avilamycin A und es scheint zusätzlich viel hydrophiler zu sein wie an den Rf-Werten abzusehen ist. Auch die nicht-chlorierten Gavibamycin-Derivate waren antibiotisch aktiv.

Beispiel 9

10

15

20

Parenterale Applikationsform

65 g Gavibamycin A3 werden in 1 l Wasser für Injektionszwecke bei Raumtemperatur gelöst und anschließend durch Zugabe von wasserfreier Glukose für Injektionszwecke auf isotone Bedingungen eingestellt.

Appliziert werden davon bei einem Durchschnittspatienten von ca. 65 kg Körpergewicht beispielsweise 0,5 ml also 32,5 mg bzw. ≈ 500 μg/kg. Die verabreichte Dosis zeigte keinerlei Kontraindikation und erwies sich für die Patienten als gut verträglich.

Zusammenfassend ist festzustellen, daß erfindungsgemäß eine detaillierte Sequenzanalyse des avi Gensatzes mehrere Merkmale aufweist, die ein Modell eines biosynthetischen Stoffwechselwegs zu erfindungsgemäßen komplexen Oligosaccharid-Antibiotika vorschlagen. Die Funktion der für Zuckerbiosynthese verantwortlichen Gene kann Aminosäuresequenzen abgeleitet werden, die solchen Proteinen ähneln, die an der Biosynthese von D-Olivose in anderen Organismen beteiligt sind. Wie für die Biosynthese von D-Olivose in Streptomyces violaceoruber Tü22 (Granaticin-Produzent) und Streptomyces fradiae (Urdamycin-Produzent) beschrieben, beginnt die Biosynthese vom Glukose-1-Phosphat, das zu dTDP-D-Olivose und dTDP-2-Deoxy-D-Evalose durch mehrere Enzyme konvertiert wird. Ein neues Merkmal in diesem Stoffwechselweg ist, daß daran drei verschiedene dNDP-Hexose-4,6-Dehydratase-Gene beteiligt sind. Auf der Basis Sequenzhomologien ist AviE1 eine dTDP-Glukose-4,6-Dehydratase und AviE3 eine GDP-Mannose-4,6-Dehydratase, was anzeigt, daß die Biosynthese von einigen dieser verschiedenen Zuckereinheiten aus verschiedenen nukleotidgebundenen Hexosepools beginnt. Auf der Basis der Struktur von Avilamycin A und außerdem indiziert durch die vermeintliche Funktion von einigen Genprodukten beginnt die Biosynthese von D-Lyxose sogar von einem dritten Zucker-Pool, so daß es sich um ein Produkt des Pentose-Phosphat-Stoffwechselwegs handeln könnte. Rest H von Avilamycin A ist ursprünglich als Methyleurekanat, abgeleitet von 2,3di-O-Methylen-4,5-Dihydroxyhexansäure, beschrieben worden. erfindungsgemäße Sequenzanalyse allerdings zeigt, daß Methyleurekanat auch das Produkt eines biosynthetischen Zuckerstoffwechselwegs ist. Dies alles zusammengenommen läßt aufgrund der Zahl Zuckereinheiten darauf schließen, daß das Avilamycin-Cluster sechs Glykosyltransferase-Gene aufweist. Allerdings sind erfindungsgemäßen Avilamycin-Cluster gefunden worden. Eine denkbare Erklärung könnte die Beteiligung von · einer oder mehr

10

15

20

25

Glykosyltransferasen in mehreren Syntheseschritten sein oder die Beteiligung von Glykosyltransferasen, die in Regionen außerhalb dieses Gen-Clusters codiert werden. Drei von vier Glykosyltransferasen erinnern stärker an Glykosyltransferasen für die Biosynthese von 0-Antigen-Strukturen oder Zellwandpolysacchariden, was durch die polysaccharidähnliche Struktur von Avilamycin erklärt werden kann.

5

15

20

25

30

Der avi Stoffwechselweg enthält sogar weitere interessante Merkmale: zwei Orthoesterbrücken und eine Methylenbrücke. Unter Berücksichtigung der oxidativen Natur dieser C-O-C-Arrangements dürften die Ketoglutarat-abhängigen Oxygnasen AviO1, AviO2 und AviO3 die Bildung dieser seltenen Bindung katalysieren. Es wird daher erfindungsgemäß beschrieben, daß solche Enzyme molekularen Sauerstoff als direkten Elektronenakzeptor für die Oxidation durch den Gebrauch von α-Ketoglutarat als Cosubstrat verwenden und hierdurch schließlich die C-Oproduzieren. C-Bindungen, Succinat und CO₂ Heptasaccharid wird durch Methylierung, durch Ankopplung von Acetat, Ankopplung von Dichloroisoeverninsäure und durch Ankopplung von einer Isobutyryleinheit modifiziert. Sechs Methyltransferase-Gene sind im Cluster vorhanden, was der Zahl nach für die Avilamycin-Biosynthese ausreicht, während die Gene die für die Ankopplung der anderen Reste verantwortlich sind, noch nicht lokalisiert worden sind. Interessanterweise wurde erfindungsgemäß herausgefunden, daß aviB1 und aviB2 solche Enzyme kodieren, die der Alpha- und der Beta-Kette von Komponenten 1 der 2-Oxosäuredehydrogenase-Komplexe ähnlich sind. Diese Komplexe werden normalerweise aus 3 enzymatischen Einheiten zusammengesetzt, nämlich den TPP-abhängigen Dyhydrogenasen (Heterotetramere ($\alpha_2\beta_2$), Dihydrolipoamide-Acetyltransferasen (Homomultimere) und Dihydrolipoamid-Dehydrogenasen (Homodimere). Die ORFs, die für die letztgenannten Komponenten dieser Komplexe kodieren, sind entweder

noch nicht lokalisiert worden innerhalb des Clusters oder werden für die Biosynthese von Avilamycin überhaut nicht gebraucht.

Weiterhin wurde Gavibamycin A3 auf seine antibiotische Aktivität getestet.

Die ersten MIC-Versuche zeigten, daß Gavibamycin A3 etwas stärker gegen verschiedene Staphylococcus aureus-Stämme als Avilamycin A aktiv ist. Darüber hinaus ist es etwas stärker hydrophil als Avilymycin A, wie durch die Retentionsfaktoren aus der TLC und HPLC-Analyse gezeigt wurde. Die nicht-chlorierten Gavibamycin-Derivate sind auch antibiotisch aktiv.

- 6. Avilamycin-Derivat, dadurch erhältlich, daß in einer kultivierbaren Zelle, die die nötigen Gene bzw. Enzyme zur Synthese eines Orthosomycin-Grundkörpers bestehend aus
 - (a) einem endständigen Dichloroisoeverninsäure-Rest (A in Formel I) und
 - (b) einem damit veresterten, über normale Esterbindung und Orthoesterbindungen verknüpften Heptasaccharid (B bis H in Formel I) aus:
 - (i) zwei D-Olivose-Resten (B und C)
 - (ii) einem 2-Desoxy-D-Evalose-Rest (D),
 - (iii) einem D-Fucose (E),
 - (iv) einem D-Mannose-Rest (F),
 - (v) einem L-Lyxose-Rest (G) und

10

5

(vi) einem (Methyl-)Eurekanat Rest (H)

16	COCH(CH ₃) ₂	COCH ₃	OCH ₃	CI 1	CI	CH₃	CH ₃	OCH ₃

7. Avilamycin-Derivat gemäß Anspruch 6, dadurch gekennzeichnet, daß die kultivierbare Zelle ausgewählt ist aus einer Zelle vom Typ Streptomyces viridochromogenes oder einer Zelle, die mit Ausnahme der gentechnologisch veränderten, deletierten oder nicht exprimierten Nukleinsäure/n die Nukleinsäuren gemäß einer Sequenz einer der laufenden Nr. 1-54 (gemäß Tabelle 1 i.V.m. Abb. 1) bzw. dazu zu mindestens 95%, vorzugsweise 97 %, homologe Nukleinsäuren enthält oder das Gencluster gemäß Abb. 109 enthält, vorzugsweise ausgewählt ist aus einer Zelle vom Typ Streptomyces viridochromogenes, insbesondere einer Zelle vom Typ Streptomyces viridochromogenes Tü 57.

5

10

20

25

- 8. Avilamycin-Derivat gemäß einem der Ansprüche 6 oder 7, dadurch gekennzeichnet, daß die veränderte/n Nukleinsäure/n für eine Methyltransferase und/oder für eine Halogenase kodierte/n.
 - 9. Avilamycin-Derivat gemäß Anspruch 8, dadurch gekennzeichnet, daß die Sequenz der veränderte/n Nukleinsäure/n vor der Veränderung mindestens zu 95%. vorzugsweise 97%.. insbesondere genau, der Nukleinsäuresequenz einer Sequenzen mit laufender Nr. 1, 2-7 oder 48-49 (gemäß Tabelle 1 i.V.m. Abb. 1), vorzugsweise einer der Sequenzen mit laufender Nr. 1 oder 2-7 (Tabelle 1 i.V.m. Abb. 1), insbesondere einer der Sequenzen mit laufender Nr. 1 und/oder 2 (gemäß Tabelle 1 i.V.m. Abb. 1), entspricht.
 - 10. Avilamycin-Derivat gemäß einem der Ansprüche 6 bis 9, dadurch gekennzeichnet, daß die Veränderung der Nukleinsäure/n dazu führt, daß das oder die durch die gentechnolgisch veränderte/n Nukleinsäure/n kodierte/n Protein/e oder Polypeptid/e nach der

gentechnologischen Veränderung nicht mehr synthetisiert wird/werden.

- Avilamycin-Derivat, gemäß einem der Ansprüche 1 bis 4, 5 oder 6
 bis 10, dadurch gekennzeichnet, daß es hydrophiler ist als Avilamycin A oder C bzw. Everninomycin (Ziracin).
 - 12. Nukleinsäure in ihrer Sequenz zu mindestens 95%, vorzugsweise 97%, insbesondere genau, entsprechend der Nukleinsäuresequenz gemäß einer der Sequenzen mit laufender Nr. 1 bis 51 (gemäß Tabelle 1 i.V.m. Abb. 1).

10

- Nukleinsäure gemäß Anspruch 12, dadurch gekennzeichnet, daß die Nukleinsäure zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen mit laufender Nr. 1 bis 32 und 48 bis 51 (gemäß Tabelle 1 i.V.m. Abb. 1), vorzugsweise 1 bis 7, insbesondere 1 oder 2, entspricht.
- 14. Gencluster enthaltend "Open reading frames", vorzugsweise 54, die in ihrer Nukleinsäuresequenz zu mindestens 95%, vorzugsweise 97%, insbesondere genau, den Nukleinsäuresequenzen gemäß den Sequenzen mit laufender Nr. 1 bis 54 (gemäß Tabelle 1 i.V.m. Abb. 1) entsprechen und die auf einerm Nukleinsäurestrang angeordnet sind, vorzugsweise gemäß Abb. 109.
 - 15. Protein oder Polypeptid in seiner Aminosäuresequenz zu mindestens 95%, vorzugsweise 97%, insbesondere genau, entsprechend der Aminosäuresequenz gemäß einer der Sequenzen mit laufender Nr. 55 104 (gemäß Tabelle 1 i.V.m. Abb. 1).

16. Protein oder Polypeptid gemäß Anspruch 15, dadurch gekennzeichnet, daß das Protein oder Polypeptid zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen mit laufender Nr. 55 bis 86 (gemäß Tabelle 1 i.V.m. Abb. 1), vorzugsweise 55 bis 61, insbesondere 55 oder 56, entspricht.

5

15

- 17. Protein oder Polypeptid kodiert durch eine Nukleinsäure gemäß einem der Ansprüche 12 oder 13.
 - 18. Gentechnologisch veränderte Zelle enthaltend mindestens eine nicht endogene Nukleinsäure gemäß einem der Ansprüche 12 oder 13, einen nicht-endogenen Gencluster gemäß Anspruch 14 und/oder ein nicht-endogenes Protein oder Polypeptid gemäß einem der Ansprüche 15-17.
 - 19. Zelle enthaltend mindestens eine gentechnologisch veränderte Nukleinsäure, deren Sequenz vor der Veränderung zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen mit laufender Nr. 1 bis 54 (gemäß Tabelle 1 i.V.m. Abb. 1) entsprach.
- 20. Zelle vom Typ Streptomyces viridochromogenes, vorzugsweise vom Subtyp Tü57, dadurch gekennzeichnet, daß mindestens eine der Nukleinsäuren mit einer Sequenz gemäß einer der Sequenzen mit laufender Nr. 1-54 (gemäß Tabelle 1 i.V.m. Abb. 1) gentechnologisch verändert oder deletiert wurde.
- 30 21. Zellen gemäß Anspruch 20, dadurch gekennzeichnet, daß mindestens eine der Nukleinsäuren mit einer Sequenz gemäß einer

der Sequenzen mit laufender Nr. 1, 2-7 oder 48-49 (gemäß Tabelle 1 i.V.m. Abb. 1), vorzugsweise 1 oder 2-7, insbesondere 1 und/oder 2 gentechnologisch verändert oder deletiert wurde.

- Verwendung einer Nukleinsäure gemäß einem der Ansprüche 12 oder 13, eines Genclusters gemäß Anspruch 14, eines Proteins oder Polypeptids gemäß einem der Ansprüche 15 bis 17 und/oder einer Zelle gemäß einem der Ansprüche 18 bis 21 zur Herstellung eines Avilamycin-Derivats, vorzugsweise gemäß einem der Ansprüche 1 bis 11.
 - 23. Verfahren zur Herstellung von Avilamycin-Derivaten gemäß einem der Ansprüche 1 bis 5 gekennzeichnet durch folgende Schritte:
- 15 (1) in einer kultivierbaren Zelle, die die nötigen Gene bzw. Enzyme zur Synthese des Orthosomycin-Grundkörpers bestehend aus
 - (a) einem endständigen Dichloroisoeverninsäure-Rest (A in Formel I) und
 - (b) einem damit veresterten, über normale Esterbindung und Orthoesterbindungen verknüpften Heptasaccharid (B bis H in Formel I) aus:
 - (i) zwei D-Olivose-Resten (B und C)
 - (ii) einem 2-Desoxy-D-Evalose-Rest (D),
 - (iii) einem D-Fucose (E),
 - (iv) einem D-Mannose-Rest (F),
 - (v) einem L-Lyxose-Rest (G) und
 - (vi) einem (Methyl-)Eurekanat Rest (H)

30

25

aufweist, wird mindestens eine Nukleinsäure, deren Sequenz zu mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz gemäß einer der Sequenzen mit laufenden Nr. 1 bis 54 (gemäß Tabelle 1 i.V.m. Abb. 1) entspricht, gentechnologisch verändert, deletiert oder nicht exprimiert,

- (2) die so gentechnologisch veränderte Zelle wird kultiviert,
- (3) der Kulturüberstand wird gewonnen,
- (4) der Kulturüberstand wird aufgearbeitet und dabei das oder die entstandene/n Avilamycin-Derivat/e aufgereinigt und isoliert,
- (5) gegebenenfalls werden unterschiedliche Derivate getrennt.
- 24. Verfahren gemäß Anspruch 23, dadurch gekennzeichnet, daß die kultivierbare Zelle ausgewählt ist aus einer Zelle vom Typ 15 Streptomyces viridochromogenes oder einer Zelle, die mit Ausnahme der gentechnologisch veränderten, deletierten oder nicht exprimierten Nukleinsäure die Nukleinsäuren gemäß einer Sequenz mit laufender Nr. 1-54 (gemäß Tabelle 1 i.V.m. Abb. 1) bzw. dazu zu mindestens 95%, vorzugsweise 97 %, homologe Nukleinsäuren 20 enthält oder den Gencluster gemäß Anspruch 14 enthält, vorzugsweise ausgewählt ist aus einer Zelle vom Typ Streptomyces viridochromogenes. insbesondere einer Zelle vom Тур Streptomyces viridochromogenes Tü 57.

25

5

- 25. Verfahren gemäß einem der Ansprüche 23 oder 24, dadurch gekennzeichnet, daß die veränderte/n Nukleinsäure/n für eine Methyltransferase und/oder für eine Halogenase kodiert/en.
- 30 26. Verfahren gemäß Anspruch 25, dadurch gekennzeichnet, daß die Sequenz der veränderte/n Nukleinsäure/n vor der Veränderung zu

mindestens 95%, vorzugsweise 97%, insbesondere genau, der Nukleinsäuresequenz einer der Sequenzen mit laufender Nr. 1, 2-7 oder 48-49 (gemäß Tabelle 1 i.V.m. Abb. 1), vorzugsweise einer der Sequenzen mit laufender Nr. 1 oder 2-7 (gemäß Tabelle 1 i.V.m. Abb. 1), insbesondere einer der Sequenzen mit laufender Nr. 1 und/oder 2, entsprach.

27. Verfahren gemäß einem der Ansprüche 23 bis 26, dadurch gekennzeichnet, daß die Veränderung der Nukleinsäure/n dazu führt, daß das oder die durch die gentechnolgisch veränderte/n Nukleinsäure/n kodierte/n Protein/e oder Polypeptid/e nach der gentechnologischen Veränderung nicht mehr synthetisiert wird/werden.

5

- 15 28. Arzneimittel enthaltend Avilamycin-Derivate gemäß einem der Ansprüche 1 bis 11 sowie gegebenenfalls geeignete Zusatz-und/oder Hilfsstoffe.
- Verwendung eines Avilamycin-Drivats gemäß einem der Ansprüche
 1 bis 11 zur Herstellung eines Arzneimittels mit antibiotischer
 Wirkung zur Behandlung bzw. zur Herstellung eines Arzneimittels
 zur Behandlung von Erkrankungen, bspw. Infektionskrankheiten.

Zusammenfassung

Die Erfindung betrifft Avilamycin-Derivate, gentechnologische biosynthetische Verfahren zu deren Herstellung, Arzneimittel enthaltend diese Verbindungen, sowie die Verwendung dieser Verbindungen zur Herstellung eines Arzneimittels gegen Infektionskrankheiten wie auch Nucleinsäuren, Proteine und Gencluster und entsprechende Zellen, die mit der Herstellung dieser Avilamycin-Derivate verbunden sind.
